In the claims:

For the Examiner's convenience, all pending claims are presented below with

changes shown in accordance with the mandatory amendment format.

1. (Currently Amended) A method comprising:

receiving a request to download data into flash memory;

halting the downloading of the data into the flash memory until the flash memory is

initialized, wherein the initialization includes reclaiming space in the flash memory to

accommodate the request, and storing pointers in a second memory to indicate different

locations within the flash memory where the data is to be stored within the flash memory;

and

storing the data into the flash memory based on the pointers stored in the second

memory.

2. (Original) The method of claim 1, wherein the initialization of the flash memory

comprises:

generating headers for the different locations within the flash memory where the data

is to be stored; and

storing the headers at the different locations within the flash memory.

3. (Original) The method of claim 1, further comprising storing the data received

from the download into a number of buffers prior to storing the data into the flash memory.

Docket No.: 42390P11006

Application No.: 09/892,816

- 4. (Original) The method of claim 1, wherein the initialization of the flash memory comprises reclaiming space within the flash memory that is reclaimable for storage of data into the flash memory.
- 5. (Currently Amended) A method comprising:

receiving a request from an external device to store data into a flash memory of a device, wherein the request includes the size of the data;

in response to receiving the request, initializing the flash memory of the device prior to receiving the data, wherein the initializing comprises:

reclaiming space in the flash memory to accommodate the request;
storing pointers, in a separate memory, to indicate a number of different locations within the flash memory where the free space is located;

determining whether the size of free space within the flash memory is greater than the size of the data; and

upon determining that the size of the free space within the flash memory is not greater than the size of the data, reclaiming space within the flash memory.

6. (Previously Presented) The method of claim 5, further comprising:

generating headers for each of the number of different locations within the flash
memory where the free space is located;

storing the headers into the number of different locations within the flash memory; transmitting a signal to the external device to transmit the data after the initialization of the flash memory is completed;

Docket No.: 42390P11006 Application No.: 09/892,816 receiving the data into a number of buffers within the device; and

storing the data within the number of buffers into the number of different locations

within the flash memory where the free space is located.

7. (Original) The method of claim 6, wherein the device is a cellular telephone and

the external device is a server coupled to a network and wherein the data is transmitted to the

cellular telephone through a wireless transmission link.

8. (Original) The method of claim 6, further comprising disabling interrupts within

the device when portions of the data are being written into the number of different locations

in the flash memory.

9. (Original) The method of claim 8, further comprising:

determining whether interrupts are pending in the device periodically during the time

the data is being written into the number of different locations in the flash memory; and

periodically halting the writing of the data into the number of different locations in

the flash memory and servicing the interrupts that are pending in the device upon

determining that interrupts are pending.

10. (Currently Amended) An apparatus comprising:

a flash memory partitioned into blocks;

a random access memory coupled to the flash memory;

Docket No.: 42390P11006 Application No.: 09/892,816

a write unit coupled to the flash memory and the random access memory, wherein the

write unit is to receive a request to download data into the flash memory and wherein the

write unit is to download the data into the flash memory; and

an initialize unit coupled to the flash memory, the random access memory and the

write unit to initialize the flash memory in response to receiving the request to download data

by reclaiming space in the flash memory to accommodate the request, and storing pointers,

prior to downloading the data into the flash memory, in the random access memory to

indicate the number of the blocks within the flash memory that are free to store the data.

11. (Original) The apparatus of claim 10, wherein the initialize unit is to store

headers at the number of different blocks within the flash memory, prior to downloading the

data into the flash memory.

12. (Original) The apparatus of claim 10, wherein the initialize unit is to reclaim

space, prior to downloading the data into the flash memory, within flash memory that is

reclaimable for storage of the data into the flash memory upon determining that the size of

free space within the flash memory is less than the size of the data to be downloaded into the

flash memory.

13. (Original) The apparatus of claim 10, wherein the write unit is to store the data

received from the download into a number of buffers prior to storing the data into the flash

memory.

Docket No.: 42390P11006

Application No.: 09/892,816

14. (Currently Amended) A system comprising:

a server coupled to a network; and

a cellular telephone wirelessly coupled to the network, wherein the cellular telephone

comprises[[,]]:

a flash memory partitioned into blocks;

a random access memory coupled to the flash memory;

a processor that is coupled to the flash memory and the random access

memory, the processor to execute a number of instructions, which when executed by

the processor causes the processor to[[,]]:

receive a request, from the server, to download data into the flash

memory;

halt the downloading of the data into the flash memory until the flash

memory is initialized, wherein the initialization includes reclaiming space in

the flash memory to accommodate the request, and storing pointers in the

random access memory to indicate the number of the blocks within the flash

memory where the data is to be stored; and

store the data into the flash memory based on the pointers stored in the

second random access memory.

15. (Original) The system of claim 14, wherein the initialization of the flash memory

comprises:

generating headers for the different locations within the flash memory where the data

is to be stored; and

Docket No.: 42390P11006

Application No.: 09/892,816

storing the headers at the different locations within the flash memory.

16. (Original) The system of claim14, further comprising storing the data received

from the download into a number of buffers prior to storing the data into the flash memory.

17. The system of claim 14, wherein the initialization of the flash memory (Original)

comprises reclaiming space within the flash memory that is reclaimable for storage of data

into the flash memory.

18. (Currently Amended) A machine-readable medium that provides instructions, which

when executed by a machine, causes the machine to perform operations comprising:

receiving a request to download data into flash memory;

halting the downloading of the data into the flash memory until the flash memory is

initialized, wherein the initialization includes reclaiming space in the flash memory to

accommodate the request, and storing pointers in a second memory to indicate different

locations within the flash memory where the data is to be stored; and

storing the data into the flash memory based on the pointers stored in the second

memory.

19. (Original) The machine-readable medium of claim 18, wherein the initialization

of the flash memory comprises:

generating headers for the different locations within the flash memory where the data

is to be stored; and

Docket No.: 42390P11006

Application No.: 09/892,816

storing the headers at the different locations within the flash memory.

20. (Original) The machine-readable medium of claim 18, further comprising storing

the data received from the download into a number of buffers prior to storing the data into

the flash memory.

21. (Original) The machine-readable medium of claim 18, wherein the initialization

of the flash memory comprises reclaiming space within the flash memory that is reclaimable

for storage of data into the flash memory.

22. (Currently Amended) A machine-readable medium that provides instructions, which

when executed by a machine, causes the machine to perform operations comprising:

receiving a request from an external device to store data into a flash memory of a

device, wherein the request includes the size of the data;

in response to receiving the request, initializing the flash memory of the device prior

to receiving the data, wherein the initializing comprises[[,]]:

determining whether the size of free space within the flash memory is greater

than the size of the data;

reclaiming space in the flash memory to accommodate the request;

upon determining that the size of the free space within the flash memory is not

greater than the size of the data, reclaiming space within the flash memory;

generating headers for each of a number of different locations within the flash

memory where the free space is located;

Docket No.: 42390P11006

Application No.: 09/892,816

storing the headers into the number of different locations within the flash

memory; and

storing pointers, in a second memory, to the number of different locations

within the flash memory to indicate where the free space is located within the flash

memory;

transmitting a signal to the external device to transmit the data after the

initialization of the flash memory is completed;

receiving the data into a number of buffers within the device; and

storing the data within the number of buffers into the number of different

locations within the flash memory where the free space is located.

23. (Previously Presented) The machine-readable medium of claim 22, wherein the

second memory is a random access memory.

24. (Original) The machine-readable medium of claim 22, wherein the device is a

cellular telephone and the external device is a server coupled to a network and wherein the

data is transmitted to the cellular telephone through a wireless transmission link.

25. (Original) The machine-readable medium of claim 22, further comprising

disabling interrupts within the device when portions of the data are being written into the

number of different locations in the flash memory.

26. (Original) The machine-readable medium of claim 25, further comprising:

Docket No.: 42390P11006 Application No.: 09/892,816

determining whether interrupts are pending in the device periodically during the time

the data is being written into the number of different locations in the flash memory; and

periodically halting the writing of the data into the number of different locations in

the flash memory and servicing the interrupts that are pending in the device upon

determining that interrupts are pending.

Docket No.: 42390P11006 Application No.: 09/892,816
